No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 25, 7

Alab_marter Devolant National Transistant, France Wester PWb2nv; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch or filter at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligon.cleotides were ligated to the bluin ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 1.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of plasmid R1. Inc vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse LNA was annealed to adaptored vector DNA, and transformed into

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified p1713 vector. Library is normalized. Library was constructed by Bento Scares and M. Fatima Bonaldo.
                                                                                                                                                                                                                   selected DNA was cloned into the pBACe3.6 vector at the EcoRI sites. The ligation products were transformed into DH10B electrocompetent cells (BRL Life lechnologies).
